Dear Hiring Manager,

From an early passion for technology — marked by a silver medal at the Brazilian Informatics Olympiad — I have built a career around resilient infrastructure and scalable backend systems. That same drive to solve complex problems at scale has defined my work at Goldman Sachs, where I support critical global trading platforms and lead internal AI initiatives that directly improve how engineering teams operate.

My experience spans the full software lifecycle: architecting and deploying high-performance APIs in Python, TypeScript, and Java; leading cloud modernization initiatives that migrated hundreds of on-premise applications to AWS and Azure using Terraform, Docker, and Kubernetes; and designing AI-powered tools with RAG and LLM orchestration that measurably accelerated internal workflows. Across these projects, I have consistently delivered production-grade solutions that raise both reliability and developer velocity.

I thrive in agile, collaborative environments where engineering rigor and product impact go hand in hand. I would welcome the opportunity to discuss how my background can contribute to your team's goals — please feel free to reach out at your convenience.

Sincerely,

Samuel Toyoshi Ishida
